## UNIT 2: MULTIPLES AND FACTORS OF A NUMBER

The multiples of a number are simply its times table
Example: the multiples of 2 are $2,4,6,8,10,12,14,16,18,20,22, \ldots$
The factors of a numbers are all the numbers that divide into it
Example: the factors of 24 are $1,2,3,4,6,8,12,24$.

## THE WAY TO FIND ALL FACTORS OF A NUMBER

Find all the factors of 24
Start off with $1 \times$ the number itself, then try $2 \times$ the number, then $3 \times$ the number and so on

| $1 \times 24=24$ |
| :--- |
| $2 \times 12=24$ |
| $3 \times 8=24$ |
| $4 \times 6=24$ |
| $5 \times ?=24$ |
| $6 \times 4=24$ |

listing the pair in rows like this, try each one in turn and put a dash if it doesn't divide exactly. When you get a number repeated you stop

So, the factors of 24 are: $1,2,3,4,8,12$, and 24 .

## Exercises

1.     - Write the first five multiples of $7,8,9,12,16$,

| Numbers | Multiples |
| :--- | :--- |
| 7 |  |
| 8 |  |
| 9 |  |
| 12 |  |
| 16 |  |

2.     - Find all the factors of $12,56,64$ and 81

## PRIME AND COMPOUND NUMBERS

## Prime number

It is a number larger than 1 which can only be divided by itself.
Example: 2, 3, 5, 7, 11, 13, 17, 19, $\ldots$
As you can see:
The only numbers that will multiply to make 7 are $1 \times 7$
The only numbers that multiply to make 13 are $1 \times 13$
In fact the only way to get any prime number is $1 \times$ itself

|  | $\mathbf{2}$ | $\mathbf{3}$ | 4 | $\mathbf{5}$ | 6 | $\mathbf{7}$ | 8 | $\mathbf{9}$ | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 1}$ | 12 | $\mathbf{1 3}$ | 14 | 15 | 16 | $\mathbf{1 7}$ | 18 | $\mathbf{1 9}$ | 20 |
| $\mathbf{2 1}$ | 22 | $\mathbf{2 3}$ | 24 | 25 | 26 | 27 | 28 | $\mathbf{2 9}$ | 30 |
| $\mathbf{3 1}$ | 32 | 33 | 34 | 35 | 36 | $\mathbf{3 7}$ | 38 | 39 | 40 |
| $\mathbf{4 1}$ | 42 | $\mathbf{4 3}$ | 44 | 45 | 46 | $\mathbf{4 7}$ | 48 | 49 | 50 |
| 51 | 52 | $\mathbf{5 3}$ | 54 | 55 | 56 | 57 | 58 | $\mathbf{5 9}$ | 60 |
| $\mathbf{6 1}$ | 62 | 63 | 64 | 65 | 66 | $\mathbf{6 7}$ | 68 | 69 | 70 |
| $\mathbf{7 1}$ | 72 | $\mathbf{7 3}$ | 74 | 75 | 76 | 77 | 78 | $\mathbf{7 9}$ | 80 |
| 81 | 82 | $\mathbf{8 3}$ | 84 | 85 | 86 | 87 | 88 | $\mathbf{8 9}$ | 90 |
| 91 | 92 | 93 | 94 | 95 | 96 | $\mathbf{9 7}$ | 98 | 99 | 100 |

- $\mathbf{1}$ is not a prime number
- The first four prime numbers are $2,3,5$ and 7
- 2 and 5 are the exceptions because all the rest end in $1,3,7$ or 9
- But not all numbers ending in $1,3,7$ or 9 are primes; only the black ones are primes.

## Compound number

Compound numbers are all the numbers that come up in times table.
Example: 4, 8, 9, 10, 12, 14, 15, .....

## EXPRESSING NUMBERS AS A PRODUCT OF PRIME FACTOR

Any number can be broken down into a string of prime numbers, all multiplied together. This is called expressing a numbers as a product of prime factors.

Factor tree method

Where you start at the top and split your number off into factors as shown. Each time you get a prime you circle it and you finally end up with all the prime factors, which can be arranged in order.

$$
420=2 \times 2 \times 3 \times 5 \times 7
$$

## Exercises

Express as product of prime factors
a) 990
b) 160

## HIGHEST COMMON FACTOR (GCF)

The highest common factor (HCF) is the largest factor between two numbers
To find the HCF for two numbers:

1) Find the factors for each number
2) Compare the factors and identify the largest numbers they have in common.

## Example:

Find the HCF for 9 and 12
Factor of 9: 1, $\mathbf{3}$ and 9
Factor of 12: 1, 2, 3, 4, 6 and 12
So the HCF for 9 and 12, is 3

## LOWEST COMMON MULTIPLE

The least common multiple (LCM) is the smallest multiple that two numbers have in common

To find LCM for two numbers:

1) Find the multiples for each number
2) Identify the lowest number which appeared in both multiplication table.

## Example

Find the LCM for 2 and 3
Multiples for $2: 2,4, \mathbf{6}, 8,10, \mathbf{1 2}, 14,16,18,20,22,24 \ldots$
Multiples for 3: 3, 6, 9, 12, 15, 18, 24, 27, $30 \ldots$
The common multiples are: $6,12,24 \ldots$
So the LCM for 2 and 3 , is 6

## Exercises

a) List the first ten multiples for 7 and 9 . What is their LCM?
b) List all the factors for 36 and 84 . What is their HCF?
