SWOT analysis

STRENGTHS

Economic:

- Consolidated international trade's activities of Algeciras' Port
- Consolidated industry, tourist activity and services
- Quality of the agricultural local products
- Tarifa's beaches are included in the "wind and water" sports' international route (windsurfing, surfing, kite, etc.).
- Euro has Increased the international level of the regional economy

Social:

- There are citizen initiatives against the new industries' installation
- Family cohesion is strong and very important

Territorial:

- Unique geostrategic situation: crossroads between Mediterranean and Atlantic sea and in-between two continents: Africa and Europe.
- Sound amount of protected territory: national park, cultural heritage, etc.

Environmental:

- Sound amount of landscape, natural and cultural resources
- High ecological value
- Good air and marine water quality
- Good weather

SWOT analysis

	WEAKNESSES
→	Economic: Reduced levels of GDP per capita. Too many traditional business. Industrial conflict Unemployment No industrial diversification Few professional qualification among young people
→	Social: Low population increase Low entrepreneurship Civil society is not involved in a collective territorial development project Limited sense of belonging in some municipalities Weak political influence at the regional, provincial, and national levels
→	Territorial: Unbalanced coast / inland territory Concentration of services and population on the coast Poor road infrastructure and public transport. Poor quality of public services (provision and maintenance). Insufficient treatment of urban waste water
→	Environmental: Pollution from industrial and maritime activities and port. Pollution from urban areas by the absence of adequate sewage treatment plants

SWOT analysis

OPPORTUNITIES

Economic:

- High potential market for technological development
- Increased international level of regional economy through new trade agreements with Morocco
- Renewable energy industry
- Development of quality tourism
- Development opportunities through European funding
- Development of traditional crafts and food production
- Development of quality local branding to market traditional products

Social:

- Cooperation and joint development in two strait's shores
- Multicultural society due to the geographical proximity to Morocco
- Young Population

Territorial:

- Geo-strategic location
- Two sub-regional plans in elaboration
- New project: Algeciras' technology campus, logistic area of Algeciras' bay and the Almoraima action plan (rural tourism, green products, sustainable development)

Environment:

- Sustainable use of cultural, natural and landscape's resources

Unión Europea

Fondo Europeo
de Desarrollo Regional

Rediam...

SWOT analysis

THREATS

Economic:

- New international markets conditions for competitiveness
- Massive import of cheaper products from Morocco
- Low quality tourist exploitation model
- Neglecting traditional agriculture and forest degradation

Social:

- Emigration of the best qualified population
- Illegal immigration route between Africa and Europe and drug trafficking

Territorial:

- Uncontrolled urban development

Environmental :

- High pressure on natural endogenous resources
- Climate change: increased soil erosion and desertification
- Deterioration of water quality
- Depletion of fish stocks
- Low and erratic rainfall
- Impact of wind turbines on the landscape and on biodiversity
- Maritime traffic in the strait

SWOT analysis

THREATS

Economy:

- New international markets conditions for competitiveness
- Massive imports of low-cost products by Morocco
- The tourist exploitation model is by low quality
- Abandonment of traditional agriculture and forest degradation

Society:

- Best qualified population emigration
- Illegal immigration route between Africa and Europe and drug trafficking

Territory:

- Urban development uncontrolled

Environment:

- High pressure on natural endogenous resources
- Climate change: increased soil erosion and desertification
- Deterioration of water quality
- Depletion of fish stocks
- Low and erratic rainfall
- Impact of wind turbines on the landscape and biodiversity
- Maritime traffic in the strait

Action plan

The goals of our action plan are:

To test the methodology:

- To test the visual impact assessment methodology
- To test the tool
- To test the visual indicators

Global scale
Generic action

To provide local plans with impartial studies:

- To provide “locals” plans and programs with impartial writing studies (Sub-regional territorial plans; Intermunicipal wind resource plan, Urban plans, etc.).

Local scale
Concrete action

To monitorise local wind farm development:

- To elaborate and make available a study for the adjustment of existing “absurd” situation in the area (saturation and unregulated wind farm developments).
- To elaborate a study on the projected wind farms impact (scenarios).

Rediam...

Scenarios – 1st Ingredient: wind potential map

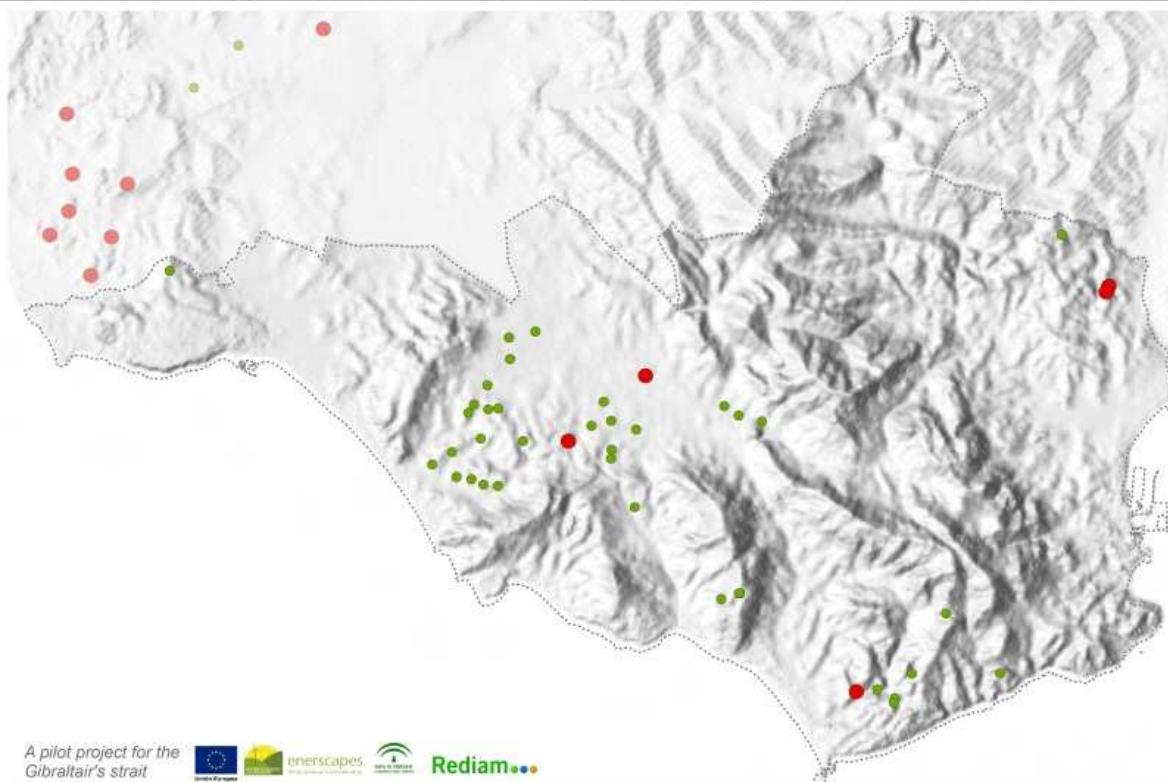

Unión Europea

Fondo Europeo
de Desarrollo Regional

Rediam...

Scenarios. 2th ingredient: Expected wind farm develop

- Projected Wind farm
- Existing Wind farm

EXISTING WIND FARM	
36	MW
TOTAL	583.26

PROJECTED WIND FARM	
NAME	MW
GUADACORTE I	12.00
GUADACORTE II	16.00
IRUELAS	21.00
LEVANTERA (AMPLIACIÓN)	13.80
TURCO (EL)	21.47
TOTAL	84.27

Scenarios. 3th ingredient: territorial resources' map

Resources	Citizen value	Expert value
Historical heritage Archaeological sites, historical towns, valuable rural buildings, historical monuments	20x	20x
Other land resources Viewer points, lighthouses, observatories, pic-nic zones, visitors centres, zoos.	20x	10x
High value agricultural land Non irrigated arable land, permanently irrigated land	5x	50x
High natural value Broad level forest, transitional woodland-scrub Mixed forest, Agro-forestiers areas	40x	50x
Urban areas	5x	20x
Geo-morphological interest land Lagoons, dunes, marshes, cliffs, etc.	5x	10x
Hydrographic networks Spring, reservoirs, rivers, etc.	5x	10x
Protected areas Sites of community importance, natural Parks, natural monuments, etc.	40x	20x
Rest	0x	2x

Scenarios. 4th ingredient: visibility model

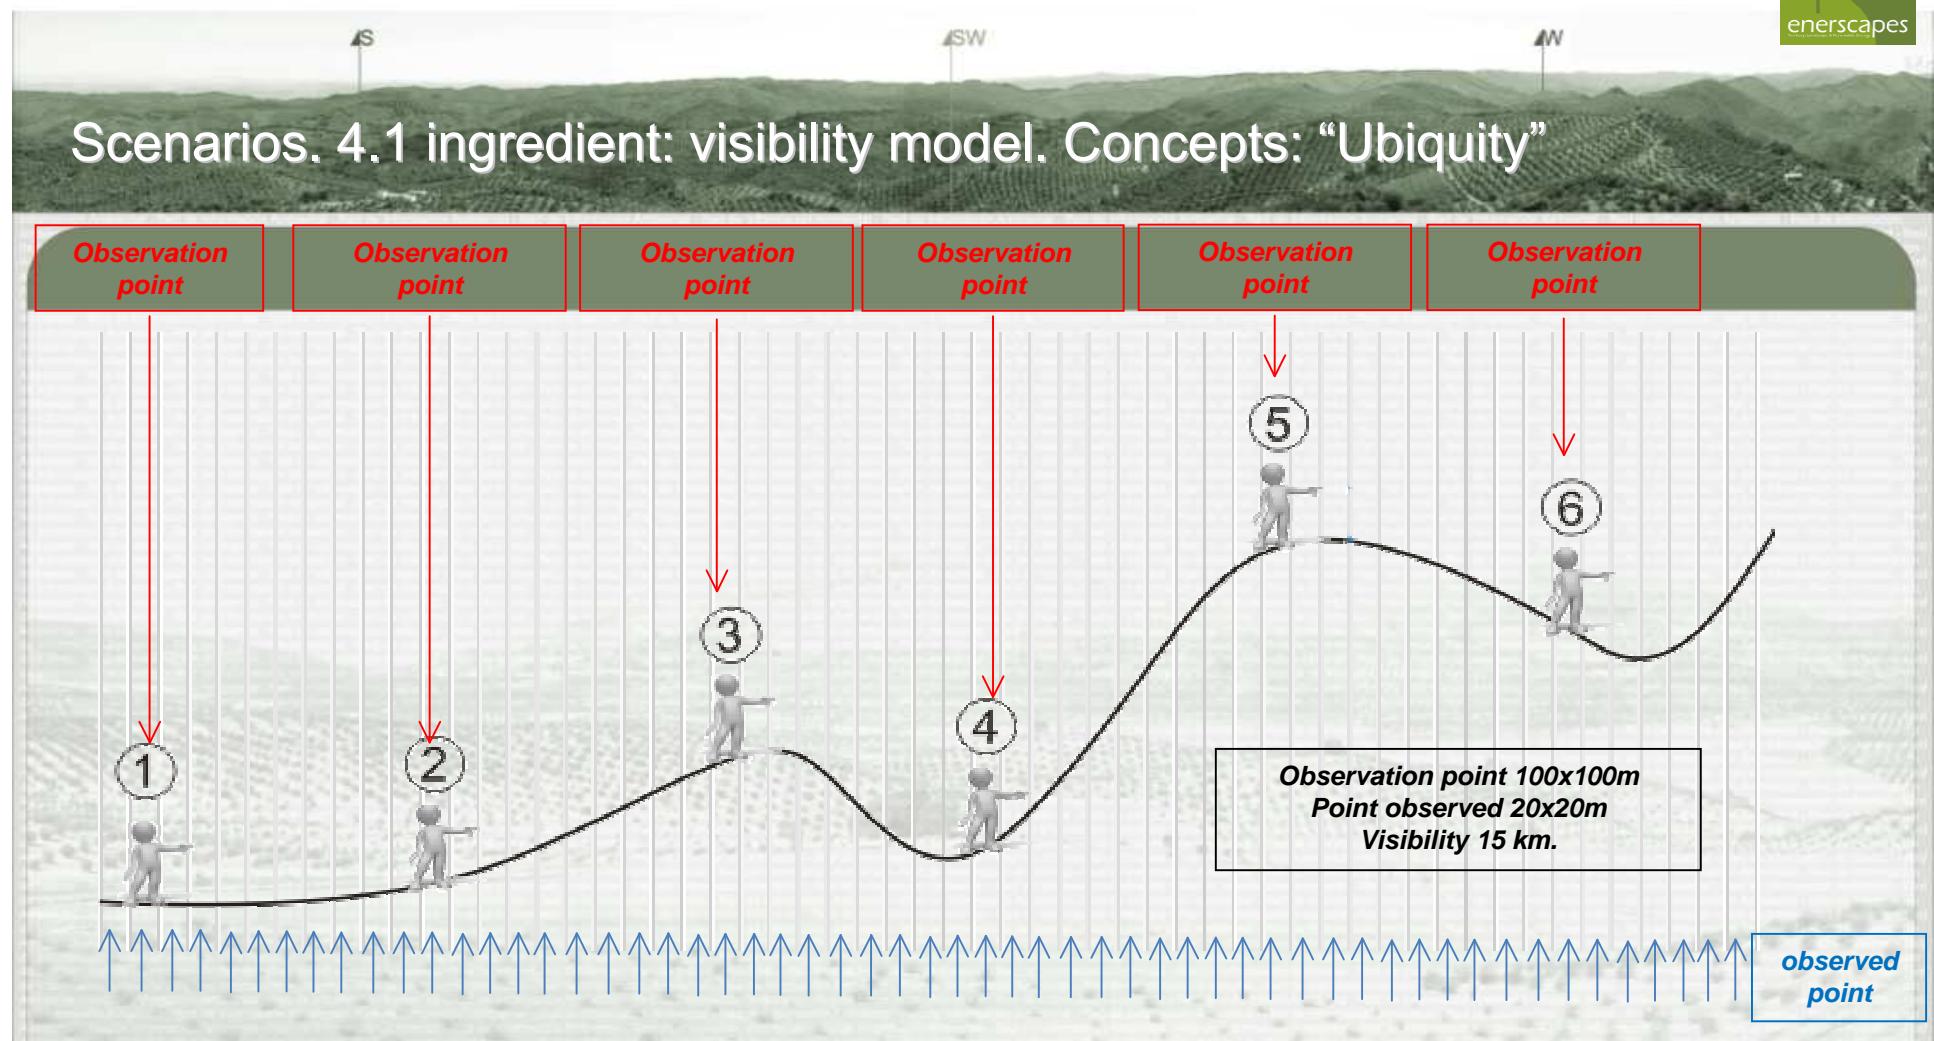

Two components make up the visual accessibility model, an application of multi-parameter visibility model

**MULTI-PARAMETER
VISIBILITY MODEL**

Rediam

Scenarios. 4.1 ingredient: visibility model. Concepts: parameters definition.

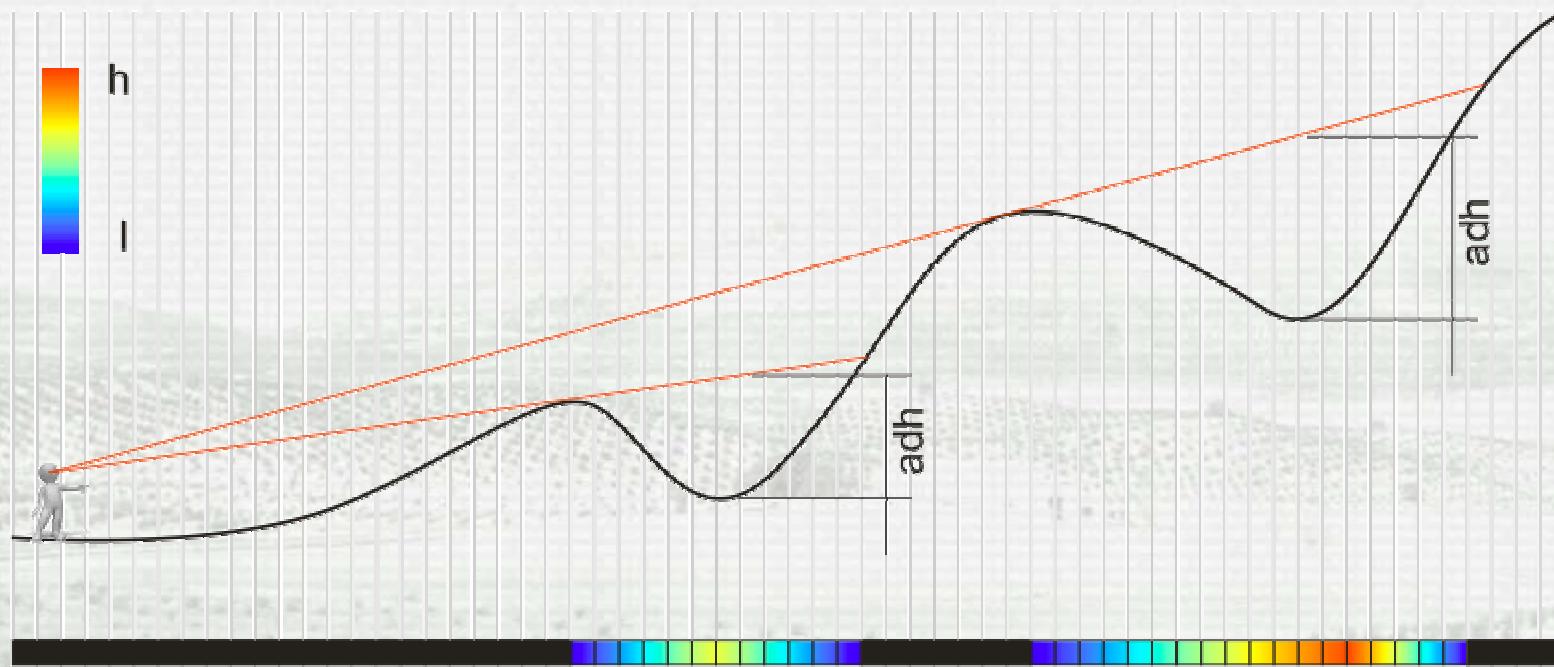

The multi-parameter model calculate 3 parameter for visible areas (visual projection, horizon point and slope), and 2 parameters for not visible area

Scenarios. 4.1 ingredient: visibility model. Concepts: parameters definition.

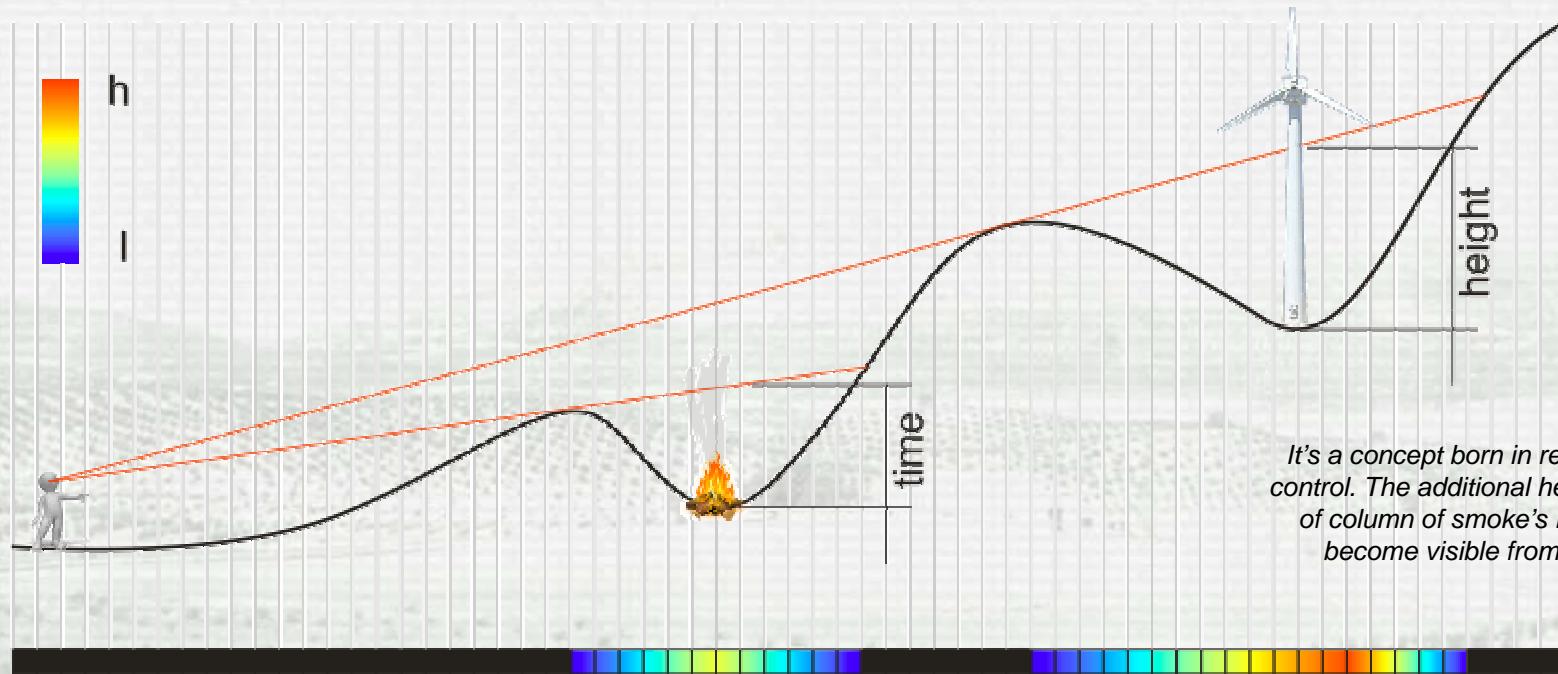

Additional height needed (non-visible points)

- Define the needed height for a point to be visible from the observation point.

Scenarios. 4.1 ingredient: visibility model. Concepts: parameters definition.

Additional height needed (to become visible)

Unión Europea

Fondo Europeo
de Desarrollo Regional

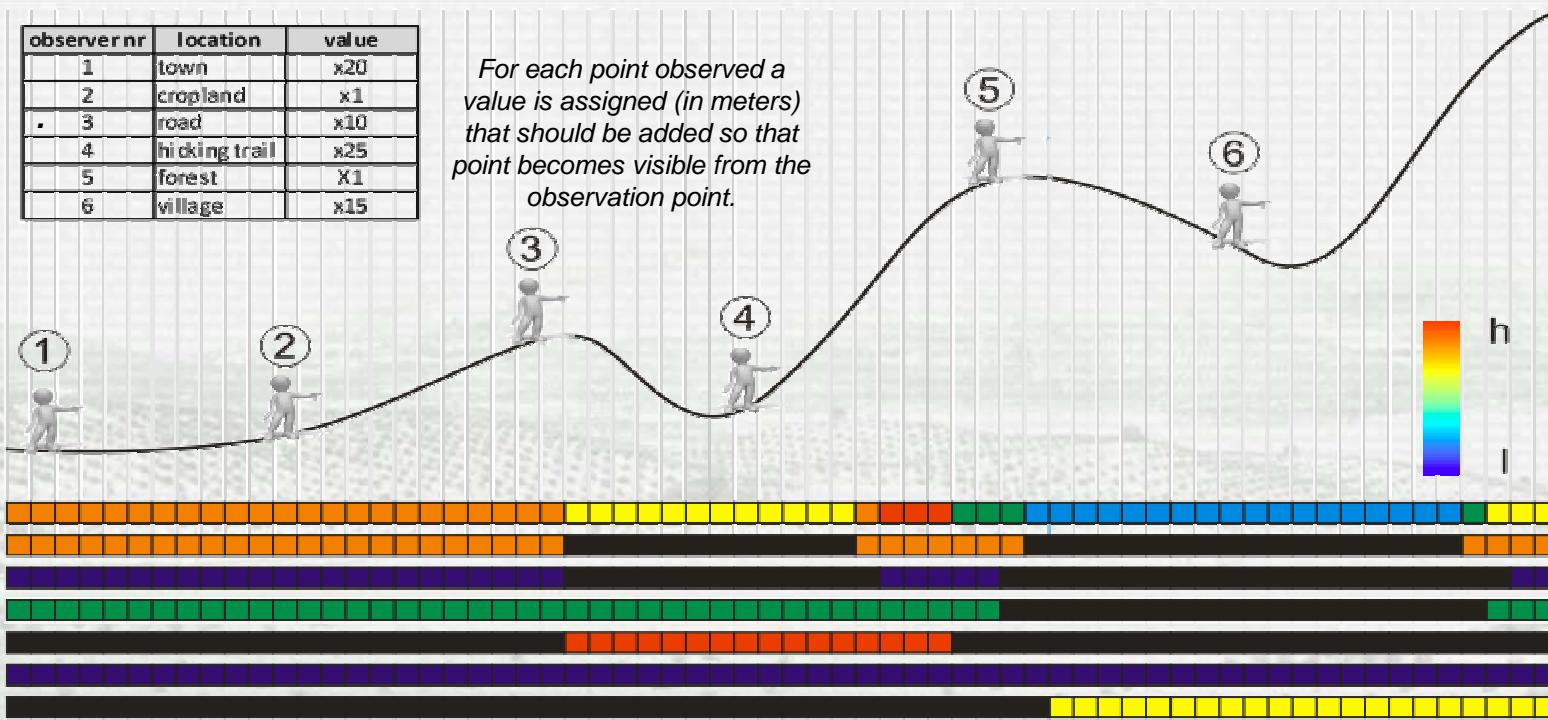

Rediam

Scenarios. 4.1 ingredient: visibility model. Concept: ubiquity & accessibility

observernr	location	value
1	town	x20
2	cropland	x1
3	road	x10
4	hiking trail	x25
5	forest	x1
6	village	x15

For each point observed a value is assigned (in meters) that should be added so that point becomes visible from the observation point.

Unión Europea

Fondo Europeo
de Desarrollo Regional

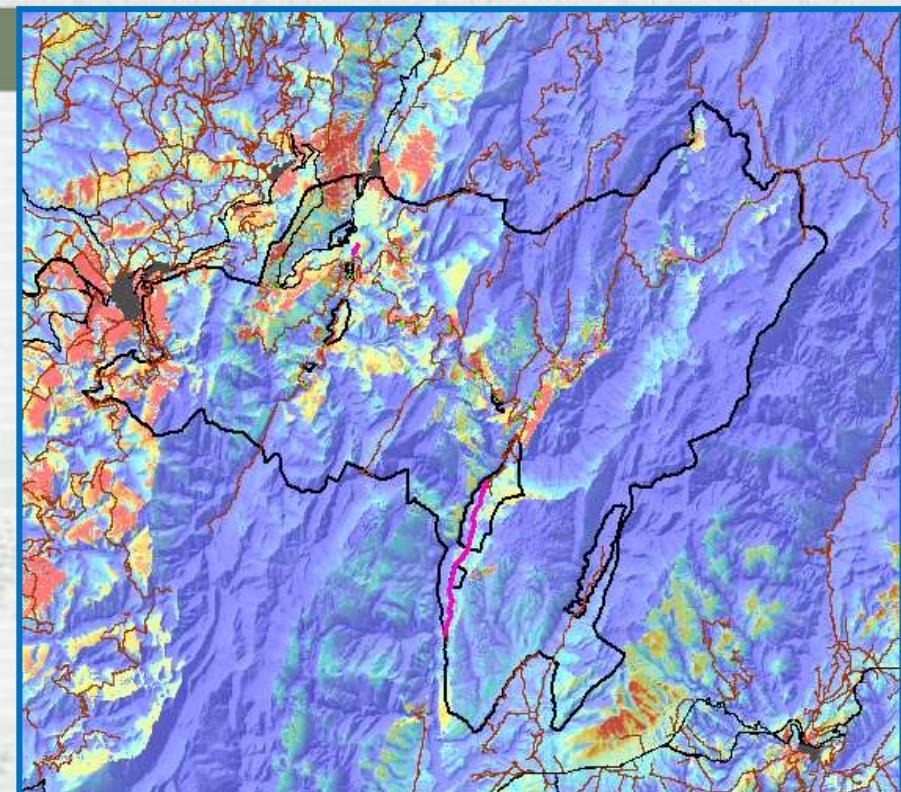

Rediam

Scenarios. 4.1 ingredient: visibility model results

Calculation of additional height based on some stretches of similar height to the wind turbine or PV plant: 0, 20, 40, 60, 80, 100, 120 m.

*The product will be a collection of **182 rasters**: 2 raster (intervisibility simple and intervisibility divided by distance) for each level of intervention (tot. 7) and local accessibility category (tot. 13).*

Unión Europea

Fondo Europeo
de Desarrollo Regional

Rediam...

Scenarios. 4.2 ingredient: accessibility model

TERRITORY'S CLASSIFICATION BASED ON LOCAL ACCESSIBILITY

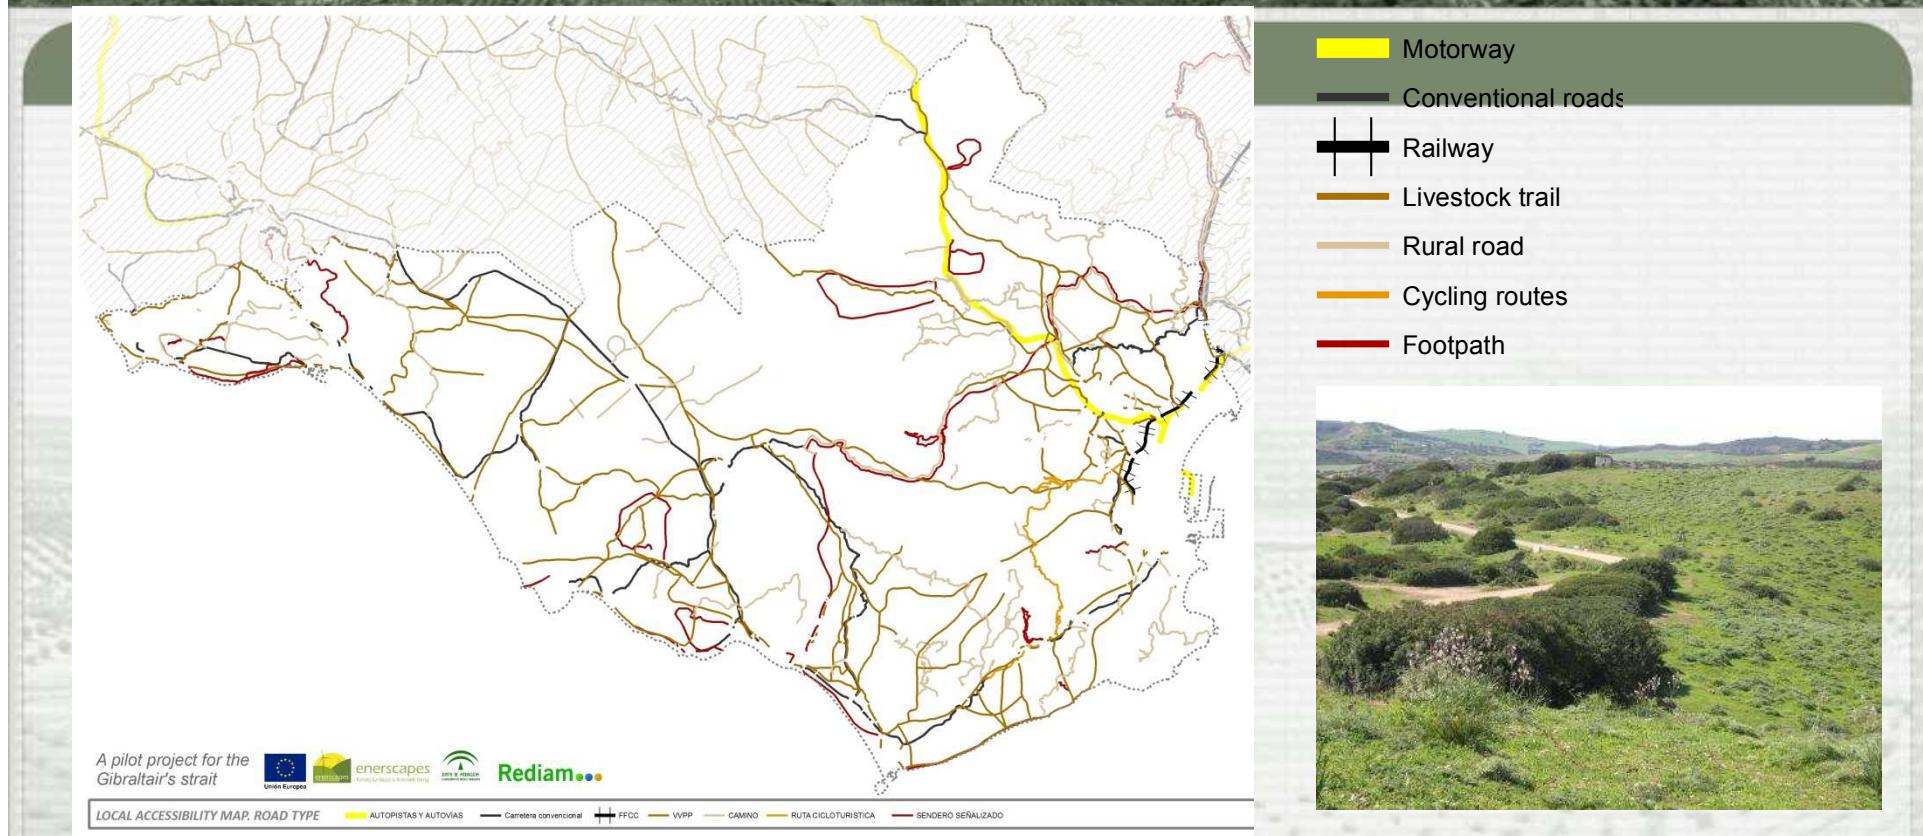

Large groups	Type	Constituents
Human settlements	Urban areas of special interest	Historic and tourist cities
	Residential areas	Urban land, including the agricultural/residential land and isolated buildings.
	No residential urban areas	Industrial and commercial zone, sporting and recreational facilities, building sites (vacant lot).
Rustic land	Non-urban altered or agricultural soils	Agricultural land, crops, wetlands, dumps and landfills, mining areas, airports and other technical infrastructure, agricultural facilities.
	Natural or forest land	Forest land and natural woodland, scrub, grassland.
Road network	Railways	In use railways
	Motorway system	Motorways, dual carriageways
	Road	Other roads
	Rural roads	Livestock trail, rural road, pathways
	Turist pedestrian route	Cycling routes, greenways, footpath
Tourism resources	High frequentation	High potential tourism resources (ex.: Baelo Claudia's archaeological site, beaches, viewer point, etc.).
	Medium frequentation	"Highlights" cultural and natural elements (monuments, castles, etc..) and nature's facilities (visitors centres, recreational areas, etc.).
	Low frequentation	Little-known Cultural and natural elements (ex.: rural buildings, caves and shelters, archaeological sites, etc..), golf courses, etc..

Scenarios. 4.2 ingredient: accessibility model. Total map

The map's objective is not the identification of a "good territory" or "bad territory". It is just the "most frequently visible territory" or the "visual inaccessible territory". It does not express any value judgments, just the number of times observed.

Scenarios' goals

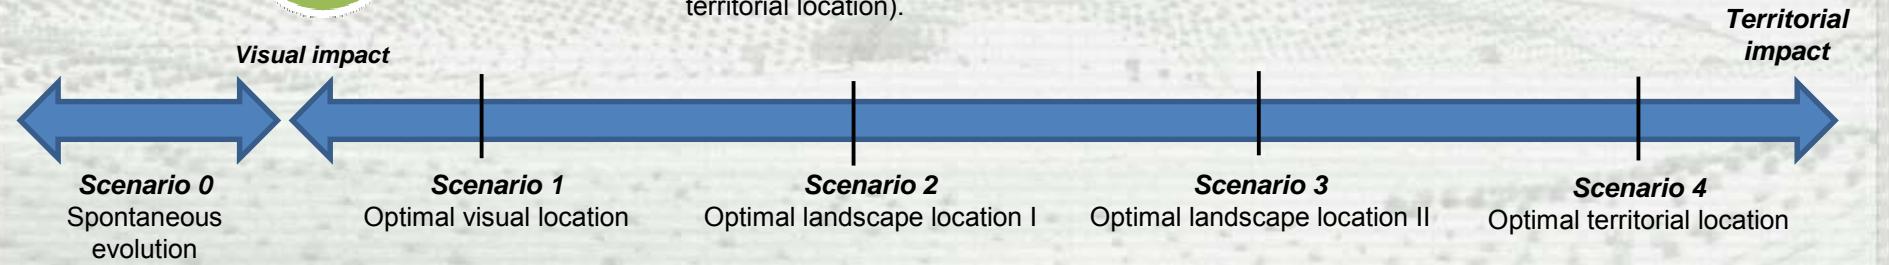

Scenario 0. Evaluation of the impact generated by the construction of 5 new wind farms in locations provided (spontaneous evolution).

Scenario 1: Impact assessment generated if the minimum visual impact is prioritised (Minimum visual accessibility).

Scenario 2: Impact assessment generated if a balance between high visual accessibility and optimal geographical location is seek, focused on the first. (Location optimum landscape II)

Scenario 3: Impact assessment generated if a balance between a high visual accessibility and excellent territorial location is prioritised, focused on the latter. (Location optimum landscape I)

Scenario 4: Impact generated if the conservation of land resources is prioritised (optimal territorial location).

STATE OF THE ART

- | | |
|---|--|
| 1.- To identify the scenarios' goals | |
| 2.- To georeference wind turbines | |
| 3.- To generate a accessibility model | |
| 4.- To generate a territorial resources' map | |
| 5.- To make the necessary calculations, as seen above: visibility model results..... | |
| 6.- Generate scenarios | |
| 5.- Compare the results with the experts' approach , and take them to public trial – broadcasting ... | |
